

# NOVEL PEPTIDE DIMERS AS AGONISTS OF THE ERYTHROPOIETIN (EPO) RECEPTOR, AND ASSOCIATED METHODS OF SYNTHESIS AND USE

## ABSTRACT OF THE DISCLOSURE

5           Novel peptide dimers are provided that bind and activate the erythropoietin receptor (EPO-R) or otherwise act as an EPO agonist. The novel compounds have a first peptide chain  $R^1$  and a second peptide chain  $R^2$ , wherein  $R^1$  and  $R^2$  may be the same or different, and are linked through a linking moiety.  $R^1$  is approximately 10 to 40 amino acid residues in length and comprises the sequence  $X_3X_4X_5GPX_6TX_7X_8X_9$  (SEQ ID NO: 1) wherein  $X_3$  is C or Hoc,  $X_4$  is  
10   R, H, L or W,  $X_5$  is M, F, I or nor-leucine (J),  $X_6$  is any one of the 20 genetically coded L-amino acids or J,  $X_7$  is W, 1-naphthylalanine (B) or 2-naphthylalanine (U),  $X_8$  is D, E, I, L or V, and  $X_9$  is C or Hoc. Similarly,  $R^2$  comprises the sequence  $X'_3X'_4X'_5GPX'_6TX'_7X'_8X'_9$  (SEQ ID NO:  
2) wherein  $X'_3$  is C or Hoc,  $X'_4$  is R, H, L or W,  $X'_5$  is M, F, I or J,  $X'_6$  is any one of the 20 genetically coded L-amino acids or J,  $X'_7$  is W, B or U,  $X'_8$  is D, E, I, L or V, and  $X'_9$  is C or  
15   Hoc. Methods for synthesizing the compounds are provided as well, as are pharmaceutical compositions and methods of use.
